

Rigid Rear Projection Screens

Rear Projection Screens are specifically designed to accept a projected image from digital projectors on the rear or back side of the screen. There are many very specific benefits to rear projection screens – one of the biggest benefits is that the image is transmitted through the screen instead of being reflected off the screen as with front projection screens. When the video image is rear projected you will never need to worry about shadows in the way of your viewing experience from people or objects being in front of the projected image coming from the projector itself.

It is important to understand also that all screens as with most technology are not created equal, as you are researching projection screen surfaces be sure to investigate and learn about what it is you are purchasing and investing in. Most every projection screen on the market is lacking one very specific and important element – technology.

In today's society technology in general is advancing at a very rapid rate, it seems as if everyday there is a extreme leap in just about any category you can imagine. The projection industry is also in on the technology advancement and is making very positive and impressive leaps in technology, 99% of all technology advancements are made in the hardware side of the industry. Projectors, Media Players, Audio Systems and even Signal Cables are making great strides of improvement; the question is why has the projection screen market not advanced significantly in the last 20 years?

Fabric projection screens are usually one of two types – chalk coated fabric or a type of sophisticated cheese cloth that holds an image; the question is this.....why is that good enough?

Screen Solutions Rear Projection Screens are what we like to call intelligent plastic; our screens are primarily acrylic based products and each start in a liquid acrylic state. When the acrylic is in its liquid state the diffusion particles and “special sauce” is added to the mix creating this truly “intelligent plastic”. Screen Solutions Front and Rear Projection Rigid and Film Screens are crafted to enhance and intensify your viewing experience and not just provide a better than nothing projection surface.

When considering a projection screen for your next home theater, corporate, tradeshow, retail or any project remember one piece of information that can be the difference between a successful projection system installation and an ok or good enough viewing experience – It's the screen that you watch”.
